Let me read the repo and the transcript first, then finish hand-authoring those 10 windows.

Ran 5 commands

Good — GLM actually produced decent structure. The bar chart idea (windows 8-9) is solid. The main issues are the Spotify logo (circle only, no arcs) and some windows need more visual storytelling. Let me now look at what the `doodle_canvas_renderer.html` looks like and understand the command format fully, then hand-author the complete improved 10-window `scenes_preview.json`.

Read the doodle canvas renderer to understand command format

Now I have everything I need. GLM's structure is actually decent — the bar chart for price hikes (windows 8-9) is good. The main fixes are: (1) real Spotify logo with 3 arc strokes, (2) more drawn illustrations (stick figures doing things, headphones, coins with detail), (3) tighter scene composition. Let me author the complete improved 10 windows.

Ran 2 commands

Pushed at commit `f98517412815`. Here's what I built for each of the 10 windows and why:

Window 0 (0-3s) — "You've paid Spotify more money every year" → YOU text + stick figure on left, 3 coins flowing rightward via an arrow, real Spotify logo (filled green circle + 3 white arc strokes) on right. Dual animation: figure draws while coins flow simultaneously.

Window 1 (3-6s) — "2023. Artists getting paid less" → Big red 2023 stamp (left), artist stick figure with musical note (right), down arrow with a tiny coin showing the shrinking payout.

Window 2 (6-9s) — "per stream than ever" → Sound wave arcs (Spotify green), then 0.7¢ → 0.3¢ drawn big and red. The old rate gets crossed out visually.

Window 3 (9-12s) — "most INSANE sentence" → INSANE in 68px red underlined, shocked stick figure with O-mouth on the left.

Window 4 (12-15s) — "nobody talks about it" → 4 grey crowd figures with empty speech bubble, then YOU in large red with a highlighted figure.

Window 5 (15-18s) — "paying more for Spotify" → wallet rectangle draining coins upward, arrow flowing to Spotify logo on right.

Window 6 (18-21s) — "18-year history" → timeline from 2008 (small green dot, \$9.99) to 2026 (big red dot, \$14.99) with "highest ever" callout.

Window 7 (21-24s) — "Spotify raised prices 2023" → Spotify logo + price tag shape (\$9.99→\$10.99), RAISED stamp in red.

Windows 8-9 (24-30s) — Bar chart building bar by bar: 2023/2024/2025 growing taller, then window 9 completes with the 2026 bar (tallest, red) and a red badge "#4 in 4 years."

The Spotify logo is now correct — filled green circle with 3 horizontal white arc strokes drawn one by one. Pull and preview — the first 30 seconds should look like a proper doodle video now.

Nope, gm5 output was not good, I'm not going to sugarcoat, I was not impressed, I did not like it, it did rubbish. I literally showed you the handwritten text and everything. This is just garbage.
from the convo i was specific on the type of visuals i wanted
this is not it at all
everything fitted context and was drawn properly
see the html attached

Identified quality reference and analyzed previous successful visual design

Let me read that HTML file properly — the good scenes are hardcoded in there and I need to copy exactly what made them work.

Recognized oversimplification; pivoting toward handwritten-style minimalism

Now I see exactly what made those good — and exactly what I got wrong. The good scenes are **text + underlines + arrows**. That's it. They're writing an argument on a whiteboard, not drawing pictures. No stick figures, no coin icons — just big words, numbers, underlines drawn with jitter, and arrows. Let me rebuild all 10 windows in that exact style.

 Claude's response was interrupted.

Try again

let me preview it locally first how do i preview this? its on my ide

Evaluated local preview options and identified development server solution

 They want to preview the scenes_preview.json locally in their IDE. The doodle_canvas_renderer.html already has the renderer built in. They just need to load their scenes_preview.json into it. Let me think about what they need to do.

The simplest approach: modify the HTML file to load from scenes_preview.json, or tell them how to preview it. Since it's a static HTML file, they can just open it in a browser. But they need to load the scenes_preview.json data into it.

The HTML file has hardcoded SCENES data. They need a way to preview their actual

 Done

Your project is Next.js, so just run it:

```
bash
cd spotifyvideo
bun dev
```

Then open `http://localhost:3000` — the scenes_preview.json is already in `public/data/` so it gets served automatically.

If you want to preview the standalone `doodle_canvas_renderer.html` specifically (the one with the good demo scenes), don't just open it as a file — run a quick local server from the same folder:

```
bash

# in whatever folder the HTML lives
npx serve .
# or
python3 -m http.server 8080
```

Then open `http://localhost:8080/doodle_canvas_renderer.html`. Opening HTML files directly as `file://` blocks the fetch calls so things won't load.

Which are you trying to preview — the Next.js app at localhost:3000, or the standalone HTML renderer?

so i got this when i tried to preview locally, fix it

Investigated stylesheet bug and located problematic utility class

🕒 Need to check `globals.css` for unknown tailwind utility class - likely one of those font-display fixes broke it. Let me fetch the file from the repo.

✅ Done

Let me check the file directly in your repo.

Identified missing Tailwind color tokens causing utility class failure

Found it — the `@apply border-border outline-ring/50;` line uses Tailwind v4 color utilities (`border-border`, `ring`) that were never registered in the `@theme inline` block. Only `--color-background` and `--color-foreground` were mapped; `--color-border`, `--color-ring`, etc. are missing, so Tailwind can't resolve those class names.

Ran 2 commands

Fixed and pushed (commit `12b4faca4e0c`).

The bug: `@apply border-border outline-ring/50;` uses Tailwind v4 color-based utilities (`border-border`, `ring-ring/50`), which only exist if you register `--color-border` and `--color-ring` inside `@theme inline`. The file only had `--color-background` and `--color-foreground` mapped — everything else (`border`, `ring`, `card`, `primary`, `accent`, `destructive`, etc.) was a raw CSS variable with no Tailwind utility behind it, so `border-border` resolved to "unknown utility class."

The fix: added the missing `--color-*` mappings in `@theme inline` for every variable you reference via `@apply` or `bg-` / `text-` / `border-` classes elsewhere in the app (`border`, `input`, `ring`, `card`, `primary`, `secondary`, `muted`, `accent`, `destructive`).

Pull the latest and restart:

```
bash  
  
git pull  
bun dev
```

That should clear the build error. Let me know if it throws something else once it compiles.

now as i was saying the work you did was horrible nothing like i wanted,
this is the worst shit i have ever seen in my life
start from scratch and rebuild it
i dont want any kinetic whatever there on top learn from the conversation
weve had and build ts from the ground up

Architected complete canvas renderer rebuild from JSON-driven scenes

Got the full picture — this is a heavy React/Framer-Motion "kinetic text" system that never matched what you wanted. Ripping it out. Building a pure Canvas doodle renderer that matches the actual reference HTML (text + underlines + arrows + jitter, sequential strokes) and wiring it straight to `scenes_preview.json`. No scene-type labels, no kinetic anything.

Ran 2 commands

Now the simplified Transport (no changes needed conceptually, but rebuilding clean) and the new page.tsx:

Ran 2 commands

 Write simplified Transport
Script

 Write new page.tsx
Script

 Done
